

---

# DETECT ATTACKS

- You know your site (and probably your client's sites) better than anyone
    - Is it running slow?
    - Are users reporting problems?
    - Does it look different?
    - Are there new logins, content or other changes?
    - Is there a spike in traffic or spam?
-

---

# EXTERNAL DETECTION TOOLS

- Don't rely on tools within the site itself to tell you there's a problem
    - Often an attack will disable known reporting and other tools
  - I recommend
    - **Jetpack** - <https://jetpack.me>
    - **New Relic** - <https://newrelic.com>
    - **Google Search Console** - <https://wordpress.org/plugins/csp-manager/>
-
