# **SECURE YOUR SERVER**

---

---

# AVOID FTP

- FTP, by itself, is unencrypted - your credentials can be intercepted
  - Use SSH (SFTP - SSH File Transfer Protocol)
    - Encrypts your connect like https
    - Most hosts already have it but some you still need to ask
    - Use key-pair certificates instead of passwords
      - Stronger than passwords
      - Often easier after setup
-
