# AVOID FTP

- FTP, by itself, is unencrypted - your credentials can be intercepted
  - Use SSH (SFTP - SSH File Transfer Protocol)
    - Encrypts your connect like https
    - Most hosts already have it but some you still need to ask
    - Use key-pair certificates instead of passwords
      - Stronger than passwords
      - Often easier after setup
-

---

# AVOID UNLIMITED ACCOUNTS

- Many hosts sell “unlimited” accounts that host multiple sites
- If one site is compromised they are all compromised
- Use separate accounts for separate websites
