## AVOID UNLIMITED ACCOUNTS

- Many hosts sell "unlimited" accounts that host multiple sites
- If one site is compromised they are all compromised
- Use separate accounts for separate websites

## HARDEN YOUR SERVER

- Probably only applies to a VPS or dedicated server
- Can greatly increase your website's security before they get to the WordPress installation
- Fail2ban
  - Actively watches logs and blocks connections
  - Requires a plugin to protect the WordPress login
- Server firewall
  - Allow users to access only the services they need and only when they need them
